

## Developing Film

1. Gather the following:
  - Tank
  - 2 reels
  - Your film canister
  - Can-opener, “emergency can”, and scissors ( all optional)
  - Spindle for tank
  - Lid
  - Daylight Bag
2. Place all of the above in the daylight bag. Put two elastics 12 inches in on each bag and slide the bag over each arm.
3. Take film out of canister. If it has receded into the film canister use the extractor, or use a can-opener to open the canister.
4. Shiny side up, take the film and lead it through the “ramps”, or “ears” on the reels. Wind the film onto the reels using a back and forth motion.
5. Place the reel with film on it onto the spindle. Place the second reel on top of that one.
6. Place the aforementioned spindle in the tank, and put the lid in. **Twist it to make sure it clicks!!!!**
7. Remove tank, clean out bag, and begin developing using the instructions in the developing room.
